

About me

As a kid, I wanted to do all the jobs that interested me. This included being an architect, professional tennis player, engineer, astronaut, and so much more! Unfortunately, there is only so much we can achieve in a lifetime. Hello guys, my name is Ojashwi and I am a freshman at Dublin High School that loves to try new things for fun!

My career goal is to be a founder of a successful technology company, with a bachelor's degree in Software Engineering. I would love to get my education at MIT or Stanford, the best technology universities in the nation. Some of my plans to get into these top schools are taking Advanced Placements courses that are relevant to engineering and business, such as AP Calculus, AP Physics, AP Microeconomics and AP Computer Science. I also plan to participate in competitive programming competitions outside of school, such as USACO (United States of America Computing Olympiad). I am currently in the Entrepreneurship Club and a Teacher Assistant in the Dublin ACE Coding Club. The reason I would like to pursue this path is that coding and economics are 2 subjects that genuinely interest me, so I would love to be in these fields.

One thing that is critically important in this field is knowledge of coding. I have been coding for one and a half years, and I understand JavaScript and Python really well. I learned some languages through extra classes, and I learned some through self-studying them because they caught my attention. Some other languages that I know how to write code for are HTML/CSS, Java, and C++. I have created games in Javascript and made sites with HTML and CSS. Another important skill to have is understanding math and logic. I am a Freshman that is currently enrolled in Advanced Algebra 2, and I am planning on taking AP Calculus AB next year.

Although academics are important, having other skills that you use daily are equally as important as well. For example, managing your time well so you do not cram at the end is a skill that you would need in order to survive in this field. Waiting until the last minute will not help you because the work will pile up and you will eventually stay up doing all of it which causes you to lose sleep. I did not miss a single assignment in 6 of my subjects during the first semester. Another skill that is very helpful to have would be to not get distracted easily and get through the work. Whenever I start an assignment, I do not do anything else except focus on that one assignment until I am finished with it. I only move on to do other things when I have submitted the assignment.
